Preface	xi
Some Hints for Troubleshooting	xiii
1 Estimating Credit Scores with Logit	1
Linking scores, default probabilities and observed default behavior	1
Estimating logit coefficients in Excel	4
Computing statistics after model estimation	8
Interpreting regression statistics	10
Prediction and scenario analysis	13
Treating outliers in input variables	15
Choosing the functional relationship between the score and explanatory variables	19
Concluding remarks	23
Notes and literature	24
Appendix	24
2 The Structural Approach to Default Prediction and Valuation	27
Default and valuation in a structural model	27
Implementing the Merton model with a one-year horizon	30
The iterative approach	30
A solution using equity values and equity volatilities	34
Implementing the Merton model with a T -year horizon	39
Credit spreads	44
Notes and literature	44
3 Transition Matrices	45
Cohort approach	46
Multi-period transitions	51
Hazard rate approach	53
Obtaining a generator matrix from a given transition matrix	58
Confidence intervals with the Binomial distribution	59
Bootstrapped confidence intervals for the hazard approach	63
Notes and literature	67
Appendix	67

4	Prediction of Default and Transition Rates	73
	Candidate variables for prediction	73
	Predicting investment-grade default rates with linear regression	75
	Predicting investment-grade default rates with Poisson regression	78
	Backtesting the prediction models	83
	Predicting transition matrices	87
	Adjusting transition matrices	88
	Representing transition matrices with a single parameter	89
	Shifting the transition matrix	91
	Backtesting the transition forecasts	96
	Scope of application	98
	Notes and literature	98
	Appendix	99
5	Modeling and Estimating Default Correlations with the Asset Value Approach	103
	Default correlation, joint default probabilities and the asset value approach	103
	Calibrating the asset value approach to default experience: the method of moments	105
	Estimating asset correlation with maximum likelihood	108
	Exploring the reliability of estimators with a Monte Carlo study	114
	Concluding remarks	117
	Notes and literature	117
6	Measuring Credit Portfolio Risk with the Asset Value Approach	119
	A default mode model implemented in the spreadsheet	119
	VBA implementation of a default-mode model	122
	Importance sampling	126
	Quasi Monte Carlo	130
	Assessing simulation error	132
	Exploiting portfolio structure in the VBA program	135
	Extensions	137
	First extension: Multi-factor model	137
	Second extension: <i>t</i> -distributed asset values	138
	Third extension: Random LGDs	139
	Fourth extension: Other risk measures	143
	Fifth extension: Multi-state modeling	144
	Notes and literature	146
7	Validation of Rating Systems	147
	Cumulative accuracy profile and accuracy ratios	148
	Receiver operating characteristic (ROC)	151
	Bootstrapping confidence intervals for the accuracy ratio	153
	Interpreting CAPs and ROCs	155
	Brier Score	156
	Testing the calibration of rating-specific default probabilities	157

Validation strategies	161
Notes and literature	162
8 Validation of Credit Portfolio Models	163
Testing distributions with the Berkowitz test	163
Example implementation of the Berkowitz test	166
Representing the loss distribution	167
Simulating the critical chi-squared value	169
Testing modeling details: Berkowitz on subportfolios	171
Assessing power	175
Scope and limits of the test	176
Notes and literature	177
9 Risk-Neutral Default Probabilities and Credit Default Swaps	179
Describing the term structure of default: PDs cumulative, marginal, and seen from today	180
From bond prices to risk-neutral default probabilities	181
Concepts and formulae	181
Implementation	184
Pricing a CDS	191
Refining the PD estimation	193
Notes and literature	196
10 Risk Analysis of Structured Credit: CDOs and First-to-Default Swaps	197
Estimating CDO risk with Monte Carlo simulation	197
The large homogeneous portfolio (LHP) approximation	201
Systematic risk of CDO tranches	203
Default times for first-to-default swaps	205
Notes and literature	209
Appendix	209
11 Basel II and Internal Ratings	211
Calculating capital requirements in the Internal Ratings-Based (IRB) approach	211
Assessing a given grading structure	214
Towards an optimal grading structure	220
Notes and literature	223
Appendix A1 Visual Basics for Applications (VBA)	225
Appendix A2 Solver	233
Appendix A3 Maximum Likelihood Estimation and Newton's Method	239
Appendix A4 Testing and Goodness of Fit	245
Appendix A5 User-Defined Functions	251
Index	257
